Modern methods of soil field research became necessary for modern soil classification of Soils. The manual of “Soil description classification and site Evolution” was created according to FAO and European standards . Using this text – research in Georgia. A modern system of codifying seems the materials that are founded in field conditions will be put in the international information soil space. Mastering in codifying is necessary for doing the job called a qualitative estimation of Georgian soils. That was done by helping of German Colleges. After getting the information about Georgian soils the dates are put into the World Reference Base for Soil Resources (WRB).

WRB doesn't change national soil classification It's just a communicative language; without that the relationship between the sciences all over the world would be impossible.
